

# **FortiSOAR Administrator**

**Duration: 2 Days** 

## **Course Description:**

In this course, you will learn about FortiSOAR architecture, and how to deploy, configure, manage, operate, and monitor FortiSOAR in a SOC environment. You will learn about various system customization options, HA deployment, security management using role-based access control (RBAC), and various system monitoring tools

## **Target Audience:**

This course is intended for cybersecurity professionals responsible for planning, deploying, configuring, and managing FortiSOAR deployments in a SOC environment.

# **Prerequisites:**

- You must have an understanding of the topics covered in FCP - FortiGate Security or have equivalent experience.
- Familiarity with SOC technologies and processes is recommended.

# **Course Objectives:**

- Identify challenges of security teams, and assist security teams with SOAR best practices
- Identify the role of SOAR in assisting security teams

- Describe the basics of SOAR technology
- Manage licenses
- Deploy and manage a FortiSOAR VM
- Configure teams, roles, and users
- Configure authentication
- Schedule the purging of audit logs and executed playbook logs
- Configure playbook recovery
- Configure environment variables
- Configure company branding
- Configure system fixtures
- Configure the recycle bin
- Monitor and manage audit logs
- Use the configuration manager
- Monitor system resources
- Deploy, configure, manage, and troubleshoot a FortiSOAR high availability cluster
- Identify the types of logs used for troubleshooting
- Collect log files used for troubleshooting
- Troubleshoot key services and processes on FortiSOAR

## **Course Outlines:**

- Introduction to FortiSOAR
- Device Management
- System Configuration
- > High Availability
- > Searching, War Rooms, and Upgrading
- > System Monitoring and Troubleshooting
